

Project Proposal

CSCI 3300-Software Engineering, Spring 2024

Descriptive Title Focused on the User Benefits

Team Number and Team Name: Group 8

Team Members: Alexander Schoolcraft, Benjamin King, Brandon King, Gabe Woolums

1. Introduction

Opening Paragraph

- What is the project?
Creating a functional registry.
- What is the motivation for this project?
To learn more about the software engineering process and the related tools.
- What is novel about it?
Unsure, but nothing we can identify at the moment.
- Anything else to orient the reader?
Nothing else to orient the reader.

Challenges

- Briefly describe the main challenges for the team.
Developing a functional user interface and the tools to integrate it with a SQL database.
- Briefly, how will you address them?
We will do research and take the time to learn the tools and systems (Primarily **JFrame**) to create the front-end and integrate it.
- Is the technology known or new to the team?
The technology is mostly new to the team.

2. Customer Need

- Who is the primary customer, outside the team?

The primary customer is someone who is looking to create a registry or someone who is looking to purchase a gift on someone's registry.

3. Project Goals

- What customer problem have you chosen to address?

The ability to create a public list for friends and family to utilize to purchase gifts for an event.

Measures of Success

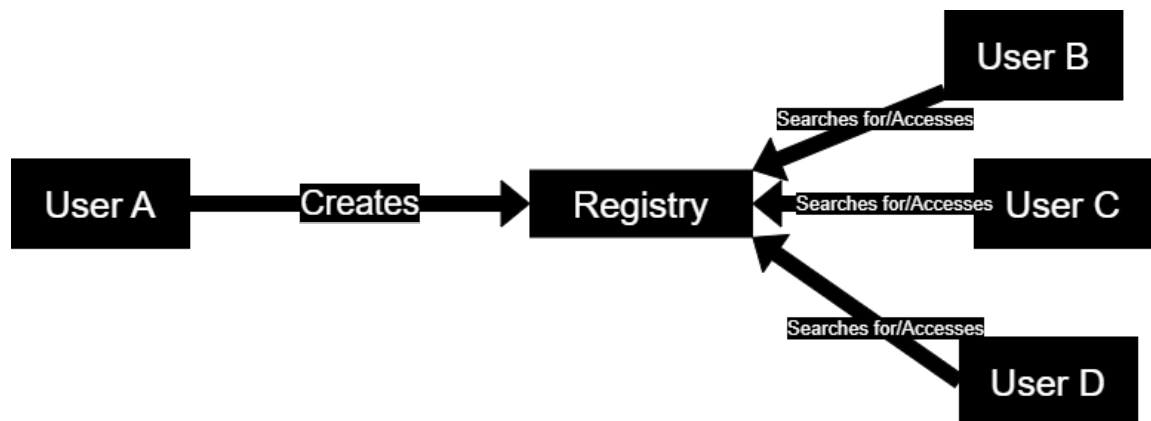

- How will you know whether the customer got their desired benefits?

If the registry displays items, is accessible and has the ability for other users to purchase the items on it.

4. System Description

For this proposal, a rough draft of this section is enough.

- Draw a block diagram to show the proposed system will interact with external

- Use the above diagram to introduce the system.

A user can either create a registry or access one. A registry will hold a description of the purpose of the registry and will display a list of items for which other users can purchase for the creator. Once created a registry will be visible if a user searches for it, and they can freely interact with and explore the registry. Users accessing the registry can purchase items directly from the registry which will be sent to the recipient.

- What are the main elements of the proposed system?

The main elements of the system are the registry itself and the components within, the items sorted inside and the tools necessary to purchase them.

5. Solution Approach

A brief rough draft of this section is enough for this proposal.

- Briefly describe how the system will work.

For creation of registries a user will need to log into program, then click the button to create a registry. Next the user will input general information pertaining to themselves and the event the registry is for, and finally the user will populate the registry by inputting links and descriptions of items. For other users accessing registries the beginning of the process will function similarly as they will first log into the program, then either browse public registries or search and find a specific registry. Once on the selected registry the user can browse items, and even purchase items from the registry. Once purchased they will be marked purchased with multiple options of privacy for the buying ranging from anonymous to public. We will use SQL for the backend and Java for the frontend.

- What platforms, tools, libraries, and the like will you use?

JFrame and Java will be utilized for creation of the frontend/user-interface and **mySQL Workbench** will be used with SQL for creation of the backend/database. Additionally, JIRA will be used for project management, and GitHub will be used for file storing. Google and a variety of other sources will be used to assist in filling any gaps in our knowledge around these tools and systems.

- How will you test it?

First, we will create a couple of sample registries like the creators of the userbase would. Then we will go through the user experience of filling in the description and populating the registry, testing these processes to user they are user-friendly and functional. Then after creating the registries, we will then access them through invite links, search, and general browsing to ensure these systems function. Finally, we will explore these lists and test out the marking as sold feature will all variations of privacy to ensure these all function as well. Finally, if the project passes these tests, we will feel comfortable and confident in the product we have created.

6. Project Management

Start a Change Log to track any changes to the project as described in this Proposal. For each entry in the Log, include 4 things: the date, description, motivation, and implications of the change.

- What development process will you use?
We will be utilizing the developmental process of SCRUM.
- What is a minimal working system that you plan to build in the upcoming iteration?
A **JFrame** user-interface which both intakes and provides information relating to a variety of registries which are stored and accessed from a SQL back-end.
- What is your wish list of features for the proposed system?
A variation of privacy options for both the list itself as well as the purchasing of the items inside these registries. Additionally multiple different options for distribution of your registry and also for searching for other registries.

Team Coordination

- How will you distribute and coordinate the work?
We will use JIRA to track progress and assign responsibility and will utilize Discord for communication and collaboration outside of class.
- How will you meet as a team? How often?
We will meet weekly in person before class on Mondays around 12:30 PM, and will maintain constant communication throughout the week over Discord.
- What do you plan to accomplish during the meetings?
We will check-in, discuss progress and issues that have arisen, as well as discuss and assign tasks for the upcoming weeks.

7. Team

Backgrounds

- What are the backgrounds of the team members?
The entire team has a moderate SQL and database background, a good understanding of Java and one member has rudimentary experience with **JFrame**.
- Any prior internships or work experience related to software development?
No
- Has anyone on the team built something like this before?
No

- Are the tools known or new to the team?

The team is somewhat familiar with the tools however not fully comfortable.

Roles

- What are the planned roles for the team members during this project?

Team lead: Alexander, Team Scribe: Benjamin, Team Facilitator: Gabe

8. Constraints and Risks

- Are there any social, ethical, policy, or legal constraints?

Avoid plagiarism, ensure we write our own code and cite any and all sources utilized.

- Will you have access to the data, services, and resources you need?

Yes we will have access to all tools necessary for this project.

- Is there anything else you might need?

At the moment there is nothing we know of.

9. Updating the Footer

Please use Print preview to automatically update the file name in the footer. You do not need to print the document, just preview it!
