# UNIVERSAL GIFT REGISTRY

BY ALEX SCHOOLCRAFT, BRANDON  
KING, GABE WOOLUMS, AND  
BENJAMIN KING.

---

# PROJECT DESCRIPTION

- The Universal Gift Registry goal is to allow everyone to make list of purchasable goods for themselves, Friends, and family. Moreover, that those friend and family members be able to purchase those items and label what the gifts are for. Events such as Graduation, birthday parties, weddings, or any other event or occasion the user may have.

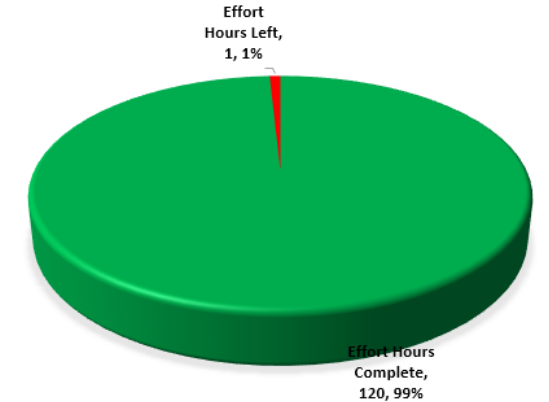

# SCHEDULE

| Task # | Description                          | Start Date | End Date  | Duration in Days | Effort Hours Estimate | Effort Hours Complete | Effort Hours Left | Input                             | Output                              | Responsible           | Status      |
|--------|--------------------------------------|------------|-----------|------------------|-----------------------|-----------------------|-------------------|-----------------------------------|-------------------------------------|-----------------------|-------------|
| 001    | Project Start and End Dates          | 2/8/2024   | 4/18/2024 | 70               |                       |                       |                   |                                   |                                     |                       |             |

# TOOLS USED

GitHub: GitHub is a platform that allows users to host their code in public repositories. We used it as a place to upload and organize all of the material related to the project, such as the code, the various documentation, and other things like images.

<https://github.com/>

Jira: Jira is a work management environment that can allow users and teams to organize work on a project, which we did with things like user stories.

<https://www.atlassian.com/software/jira>

Draw.IO: This is a free, online diagram developing software that can be used to make flowcharts, ER diagrams, network diagrams and more. We used it to make the diagram for the architecture model we used on the project.

<https://app.diagrams.net/>

Eclipse IDE and e(fx)clipse plugin: Eclipse is an IDE used for Java code development, which we used for the coding in our project. We also used the JavaFX plugin to develop the application that our website runs on.

Azure SQL Server: We used Azure to host the server that our registry is on.

Apache Maven: Maven is a project management tool used primarily for Java projects. We used it to organize and manage the Java project.

<https://maven.apache.org/>

Scene Builder 2.0: Scene Builder is used with the JavaFX plugin and can allow you to layout the controls of the JavaFX UI.

<https://www.oracle.com/ava/technologies/javafx-scene-builder-source-code.html>

Advanced BAT to exe Converter: This is a tool that allowed us to convert batch files into exe files for distribution.

<https://www.battoexeconverter.com/>

Discord: Discord is a messaging platform and app that we use for communication and meetings with the group.

<https://discord.com/>

ChatGPT: We used AI to create the logo for our registry system.

<https://chat.openai.com/>

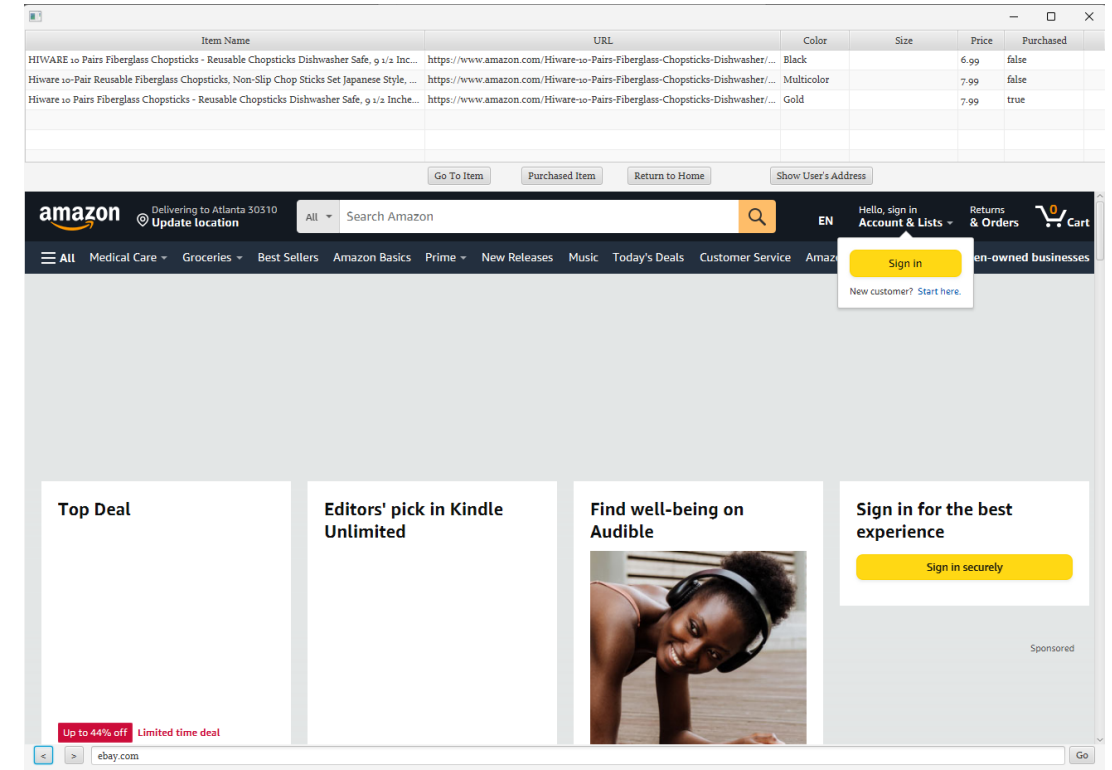

PowerPoint: We just used Microsoft PowerPoint to create the power point presentation.

Excel: When we started testing, we organized the tests and the results of those tests on an excel spreadsheet.

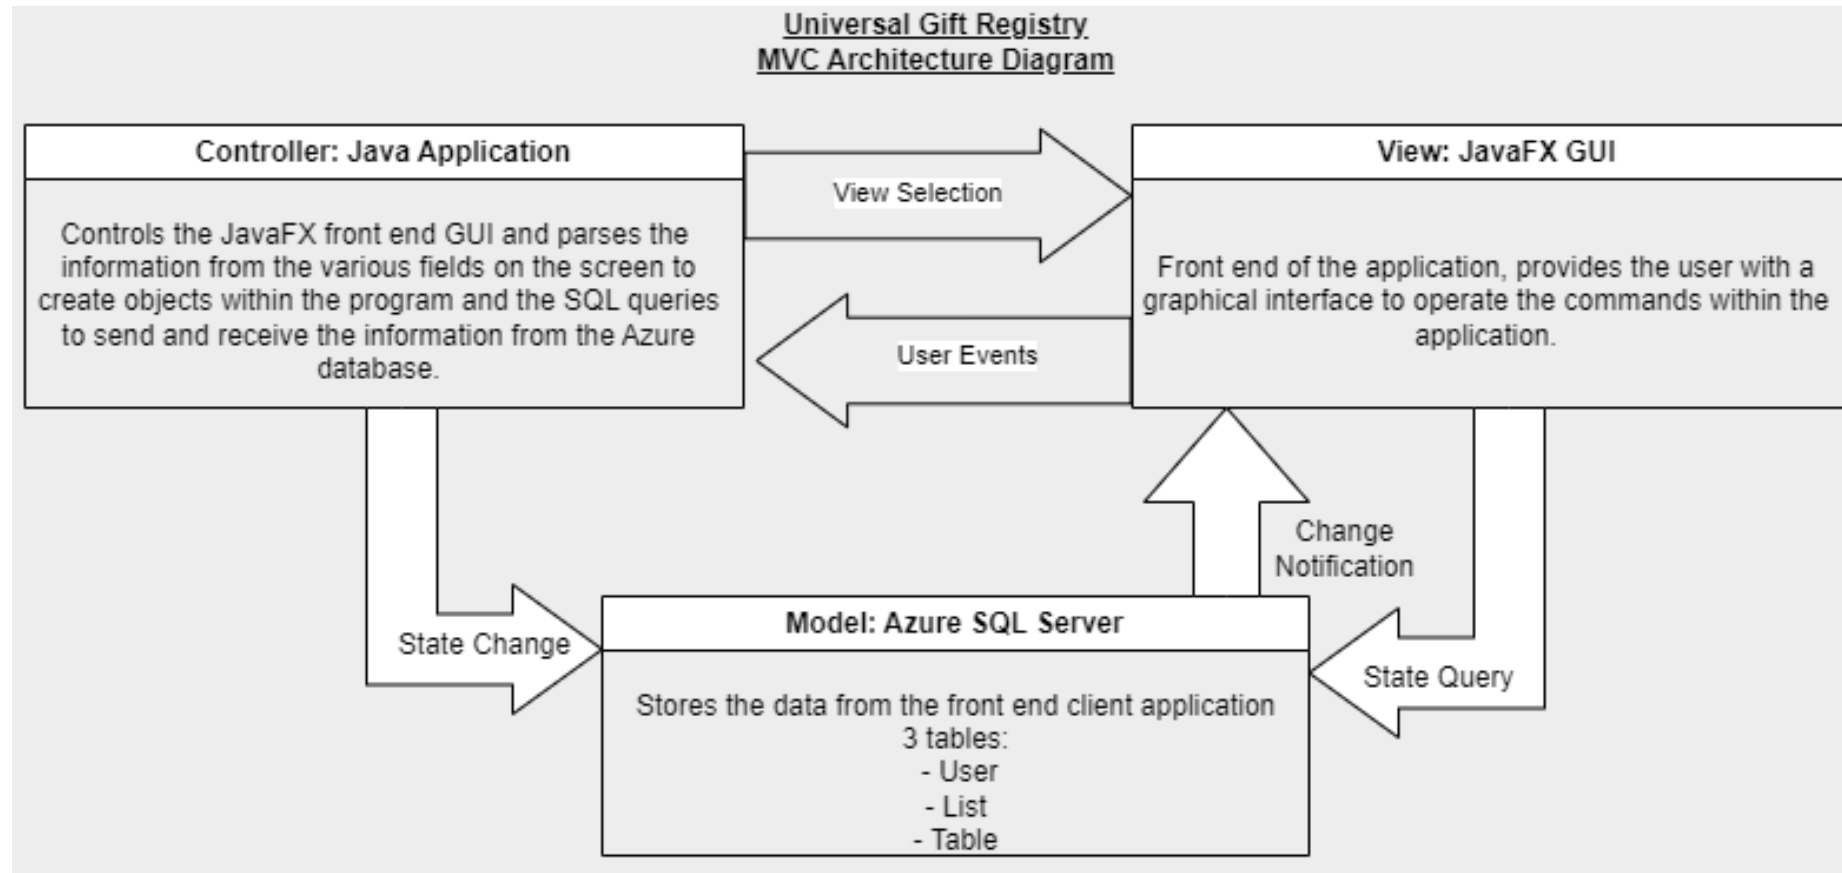

Word Docs: Microsoft Word was used for a lot of the documentation for this project.

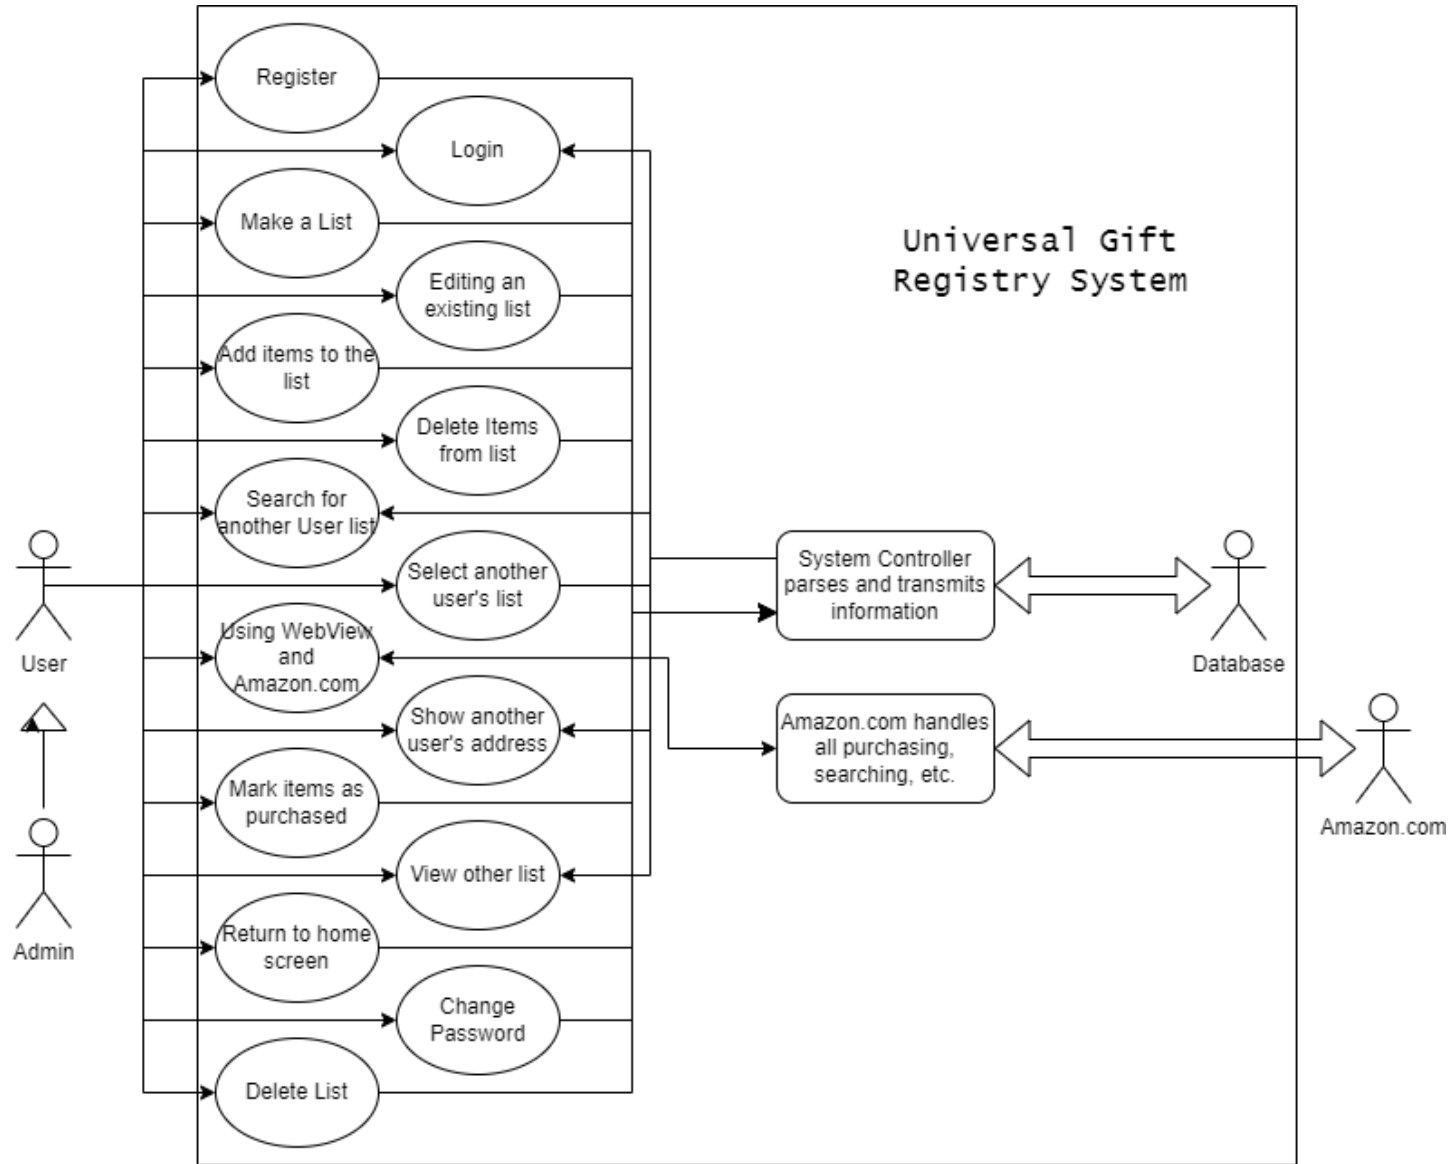

# FEATURES

- Make a list for family... friend events.
- Delete list.
- Others and yourself should be able to purchase items from these list.
- Search for list.
- Make an account using an email and password.
- Change the status of an item to be purchased

# ARCHITECTURE

# USE CASE

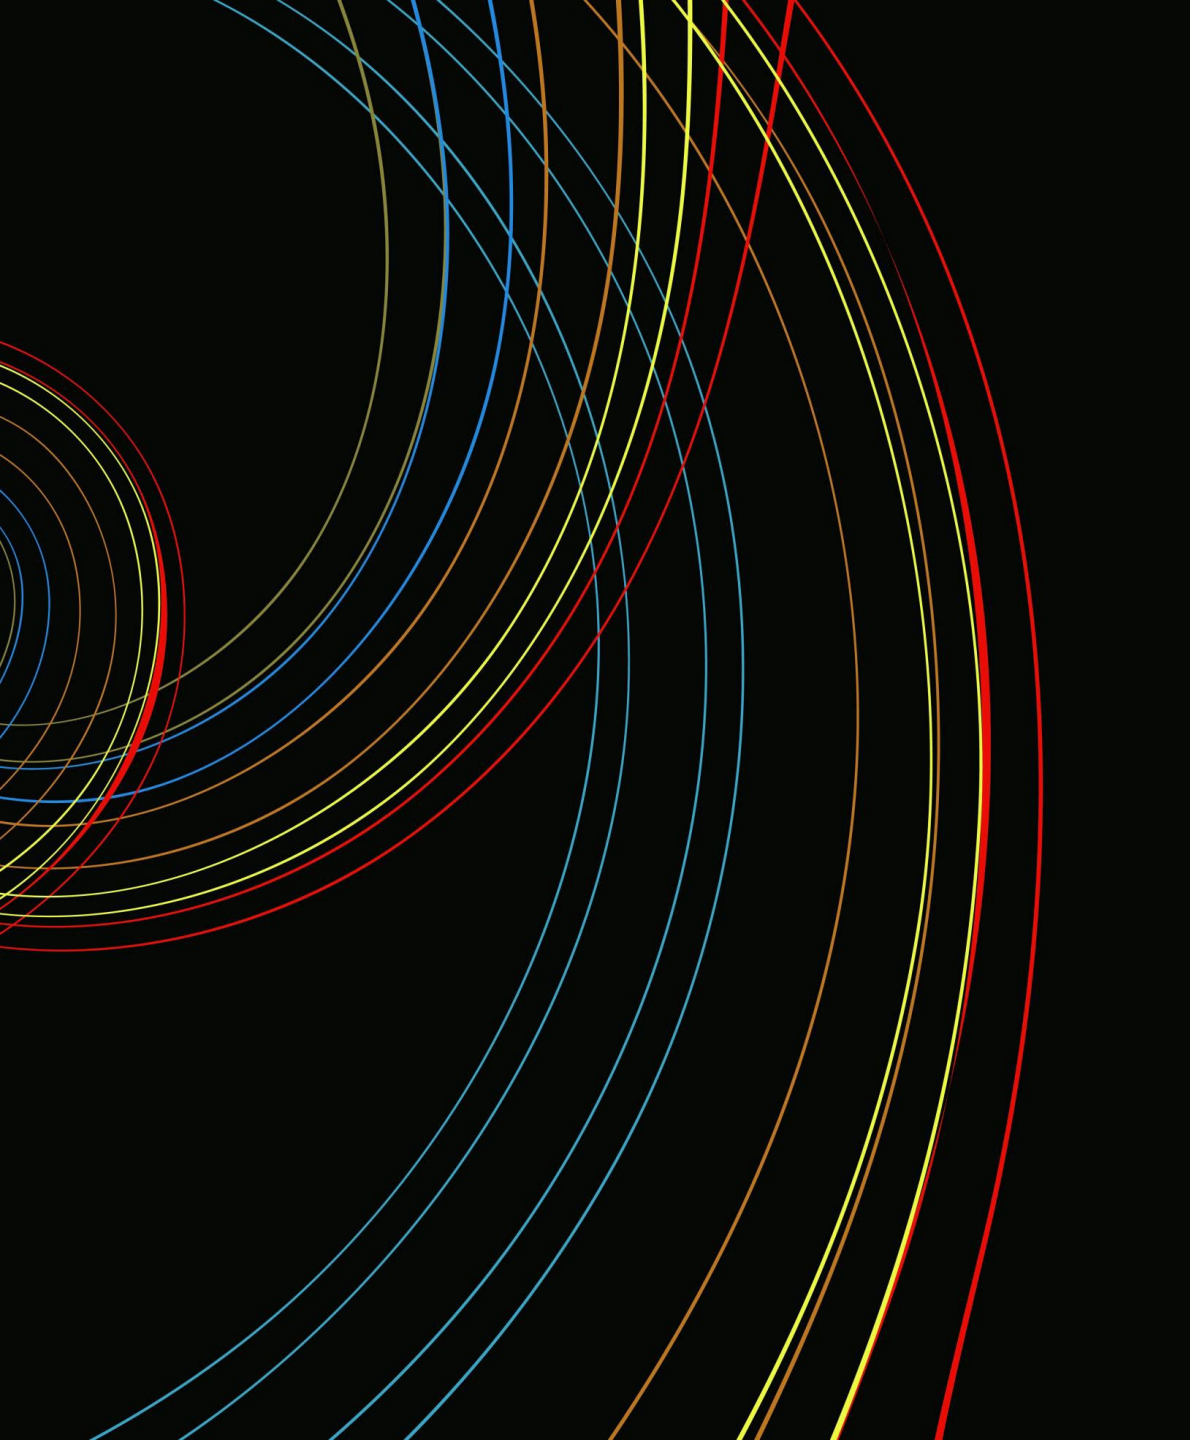

---

# USER STORIES

- Scrum 1 - As a user, I need to be able to register and log into the system.
- Scrum 2 - As a user if I forget my password I need to be able to reset it.
- Scrum 3- I should be able to refund what I have contributed to an item.
- Scrum 4- After a gift is purchased, I need to be able to mark it on the list as purchased
- Scrum 5 - As a user building my list, it would be helpful to have the system and interface interact with other sites to allow for the ones buying the gifts to directly go to the site.
- Scrum 6- I need to be able to navigate the application and web page
- Scrum 7 -As a user, I need to be able to delete a list.
- Scrum 8 -As a gift-giver, I need to be able to use my credit and debit cards with the system, to supply money for the various options, and the information should be stored securely, according to PCI DSS standards.
- Scrum 9- There should be a working user interface, that incorporates both the storage system backend, as well as the vendor's information, in a clean and presentable manor.

---

## USER STORIES CONTINUED...

- Scrum 10- As a gift-giver, I should be able to search for others' registries so that I can buy gifts for them
- Scrum 11- It would be nice to be able to sort the registries by various factors, such as order of importance, price, etc.
- Scrum 12- Using JavaFX, and its built-in WebView, create a system that can store the information about products, as well as the purchase link.
- Scrum 13- The program needs to gather the information from the viewed item to store it on the registry list.
- Scrum 14- As a purchaser, I should be able to mark an item as purchased anonymously or hide that it was purchased from the recipient so that they do not know exactly what they are getting.
- Scrum 15- As a user if a new product becomes available after the creation of my registry, I need to be able to add it to my list.
- Scrum 16- As a user I might need to make my registry private so others cannot view it unless given a link or permission.
- Scrum 17- As a user I need to be able to supply my address/shipping information for long-distant relatives or friends who are gifting me items.
- Scrum 18- As a user I would need an option to include a message along with my gift if I am purchasing for a long-distance friend or family.

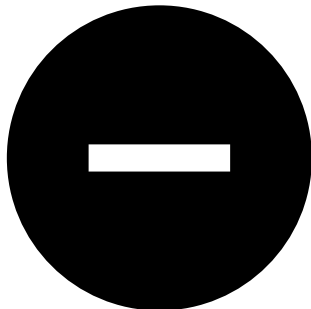

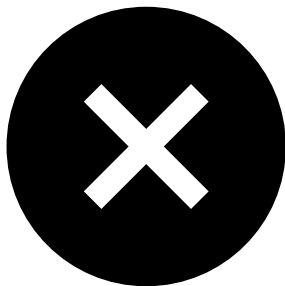

---

# CONTINUED...

- Scrum 19- As a user creating a registry, I need to be able to include my name and a brief description of my event to users looking at my registry.
- Scrum 20- If possible, can we add in some sort of AI/web crawler that can search and find the best price?
- Scrum 21- The system needs to be able to store data for the lists, including product names, urls, images, and other details
- Scrum 22 -System needs to store user information, ie usernames, names, addresses (for mailing gifts to if needed), and what list is theirs

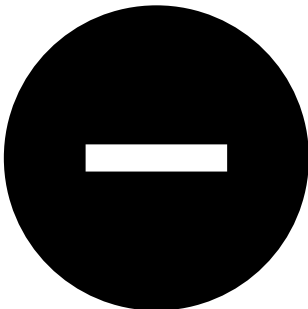

# TEST CASES

---

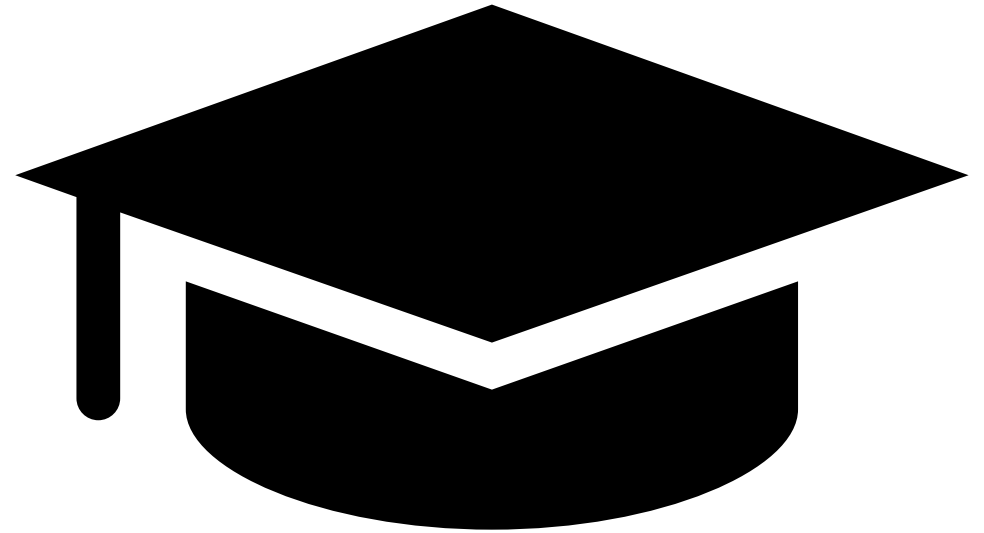

# TESTING RESULTS AND SOLUTIONS

- Several of the tests regarding error messages failed to display the correct error, indicating that the validations did not work.
  - Modified the logic for the validations to display the correct error
- When searching for another user's lists, if the field was not filled out or if the user did not exist, it caused the program to have a fatal error.
  - Added in field validation and verified that the user exists prior to the program switching over to the new page.

---

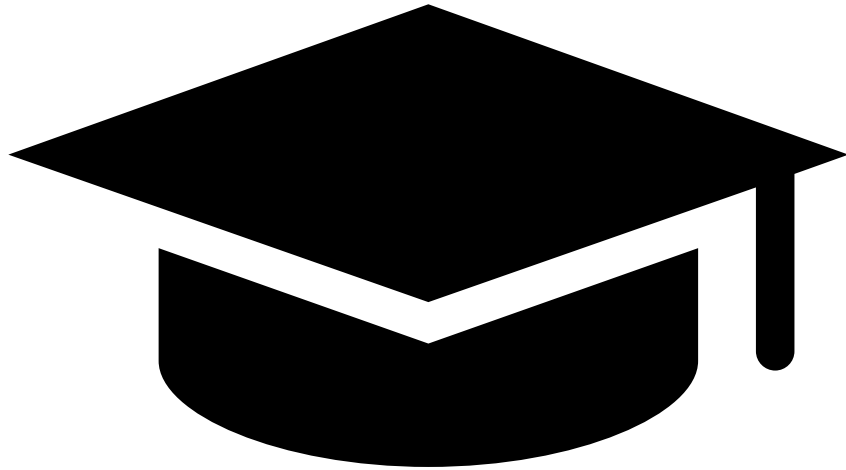

# LESSONS LEARNED

- The PreparedStatement object class that we used for the SQL queries is a very powerful object when dealing with user inputs, as it automatically wraps any text input as a string before any processing. This helps to prevent several problems with user inputs, including null-pointer exception, as well as more nefarious issues, such as SQL injection or Cross-Site Scripting.
- Adaptability is key throughout the process, as we went through several changes throughout the whole project, until we were able to settle on a specific program design and architecture.

---

# LESSONS LEARNED

- One major issue that we ran into was after the submission of the project, when the group that was evaluating our project tried to run it. While building our code, we were using the latest version of Java, which at the time was JDK21, and thought that peoples' computers would have kept their edition of Java up-to-date, but this was not the case. The team that got ours needed to update their version of Java to JDK21 before they could run it – even the latest version of JRE would not run it. This should have been something that we thought of before hand and included in the installation instructions and user guide, however, we did not think that it was going to be an issue.
