

Lessons Learned

1. The PreparedStatement object class that we used for the SQL queries is a very powerful object when dealing with user inputs, as it automatically wraps any text input as a string before any processing. This helps to prevent several problems with user inputs, including null-pointer exception, as well as more nefarious issues, such as SQL injection or Cross-Site Scripting.
2. Adaptability is key throughout the process, as we went through several changes throughout the whole project, until we were able to settle on a specific program design and architecture.
