Tools Used

GitHub: GitHub is a platform that allows users to host their code in public repositories. We used it as a place to upload and organize all of the material related to the project, such as the code, the various documentation, and other things like images.

<https://github.com/>

Jira: Jira is a work management environment that can allow users and teams to organize work on a project, which we did with things like user stories.

<https://www.atlassian.com/software/jira>

Draw.IO: This is a free, online diagram developing software that can be used to make flowcharts, ER diagrams, network diagrams and more. We used it to make the diagram for the architecture model we used on the project.

<https://app.diagrams.net/>

Eclipse IDE and e(fx)clipse plugin: Eclipse is an IDE used for Java code development, which we used for the coding in our project. We also used the JavaFX plugin to develop the application that our website runs on.

<http://eclipseide.org>

Azure SQL Server: We used Azure to host the database server that our registry runs on.

Apache Maven: Maven is a project management tool used primarily for Java projects. We used it to organize and manage the Java project.

<https://maven.apache.org/>

Scene Builder 2.0: Scene Builder is used with the JavaFX plugin and can allow you to layout the controls of the JavaFX UI.

<https://www.oracle.com/ava/technologies/javafx-scene-builder-source-code.html>

Advanced BAT to exe Converter: This is a tool that allowed us to convert batch files into exe files for distribution.

<https://www.battoexeconverter.com/>

Discord: Discord is a messaging platform and app that we use for communication and meetings with the group.

<https://discord.com/>

ChatGPT: We used AI to create the logo for our registry system.

<https://chat.openai.com/>

Microsoft Office Suite: Several programs as one suite to document important information.
