

CSCI 4810 Project

- Please identify a problem in the field of digital signal processing.
- Then find a solution to solve the problem.
- To do so, you may need to read some research papers. Use Google Scholar to find the papers you want to read.

Notes:

- Your project should not be a trivial one, yet you need to make sure you choose one you can finish this semester.
- **Your project MUST be a programming project and recommended to be an implementation in Matlab or other languages approved by the professor.**
- You need to write a formal technical report, following the example I will give you.
- Your codes should involve significant implement(s) of digital signal processing algorithm(s), though you can feel free to use any Matlab functions.

Deliverables:

- ♦ Your codes (.m files) and technical report (PDF) submitted to D2L.
- ♦ Presentation with project demo (Schedules will be sent out later). You need to prepare a set of PPT slides for your presentation too.

Grading Matrix

Item	Excellent	Good	Average	Poor
Technical significance	30	20	15	10
Project completeness	20	15	10	5
Implementation correctness	20	15	10	5
Technical report writing	20	15	10	5
Project presentation	10	8	7	5
